

ASAPS Modern - User Feedback

v0.9.28 / macOS / First-time user, no prior ASAPS experience

Issues Encountered

- Could not connect beats. The handles on each beat node look like they should be draggable (this is the standard interaction in every node-based editor), but dragging them does nothing. I eventually found that connections are set via dropdowns in the Inspector, but this was not discoverable on its own. The User Guide also does not explain how to connect beats.
- In the visual editor, after adding a text box I could not find a way to edit its content. Clicking or double-clicking the text box did not open any editing interface. It was unclear how to modify text once placed.
- First launch on macOS was blocked by Gatekeeper with a malware warning. Required going into System Settings to manually allow the app. This will stop many users before they even try the tool.

Feature Requests

- Persistent overlays and HUD elements. There is currently no way to have a resource bar, status display, or any UI element that stays on screen across beats. For games that track things like budget, supplies, or health, this is essential.
- Ink format import. Ink is widely used for interactive narrative and there is no importer for it. Twine and Ren'Py are supported, but a significant portion of the narrative community uses Ink.
- A quick-start tutorial or starter template on first launch. The blank canvas with no guidance makes the first minute feel lost.
